
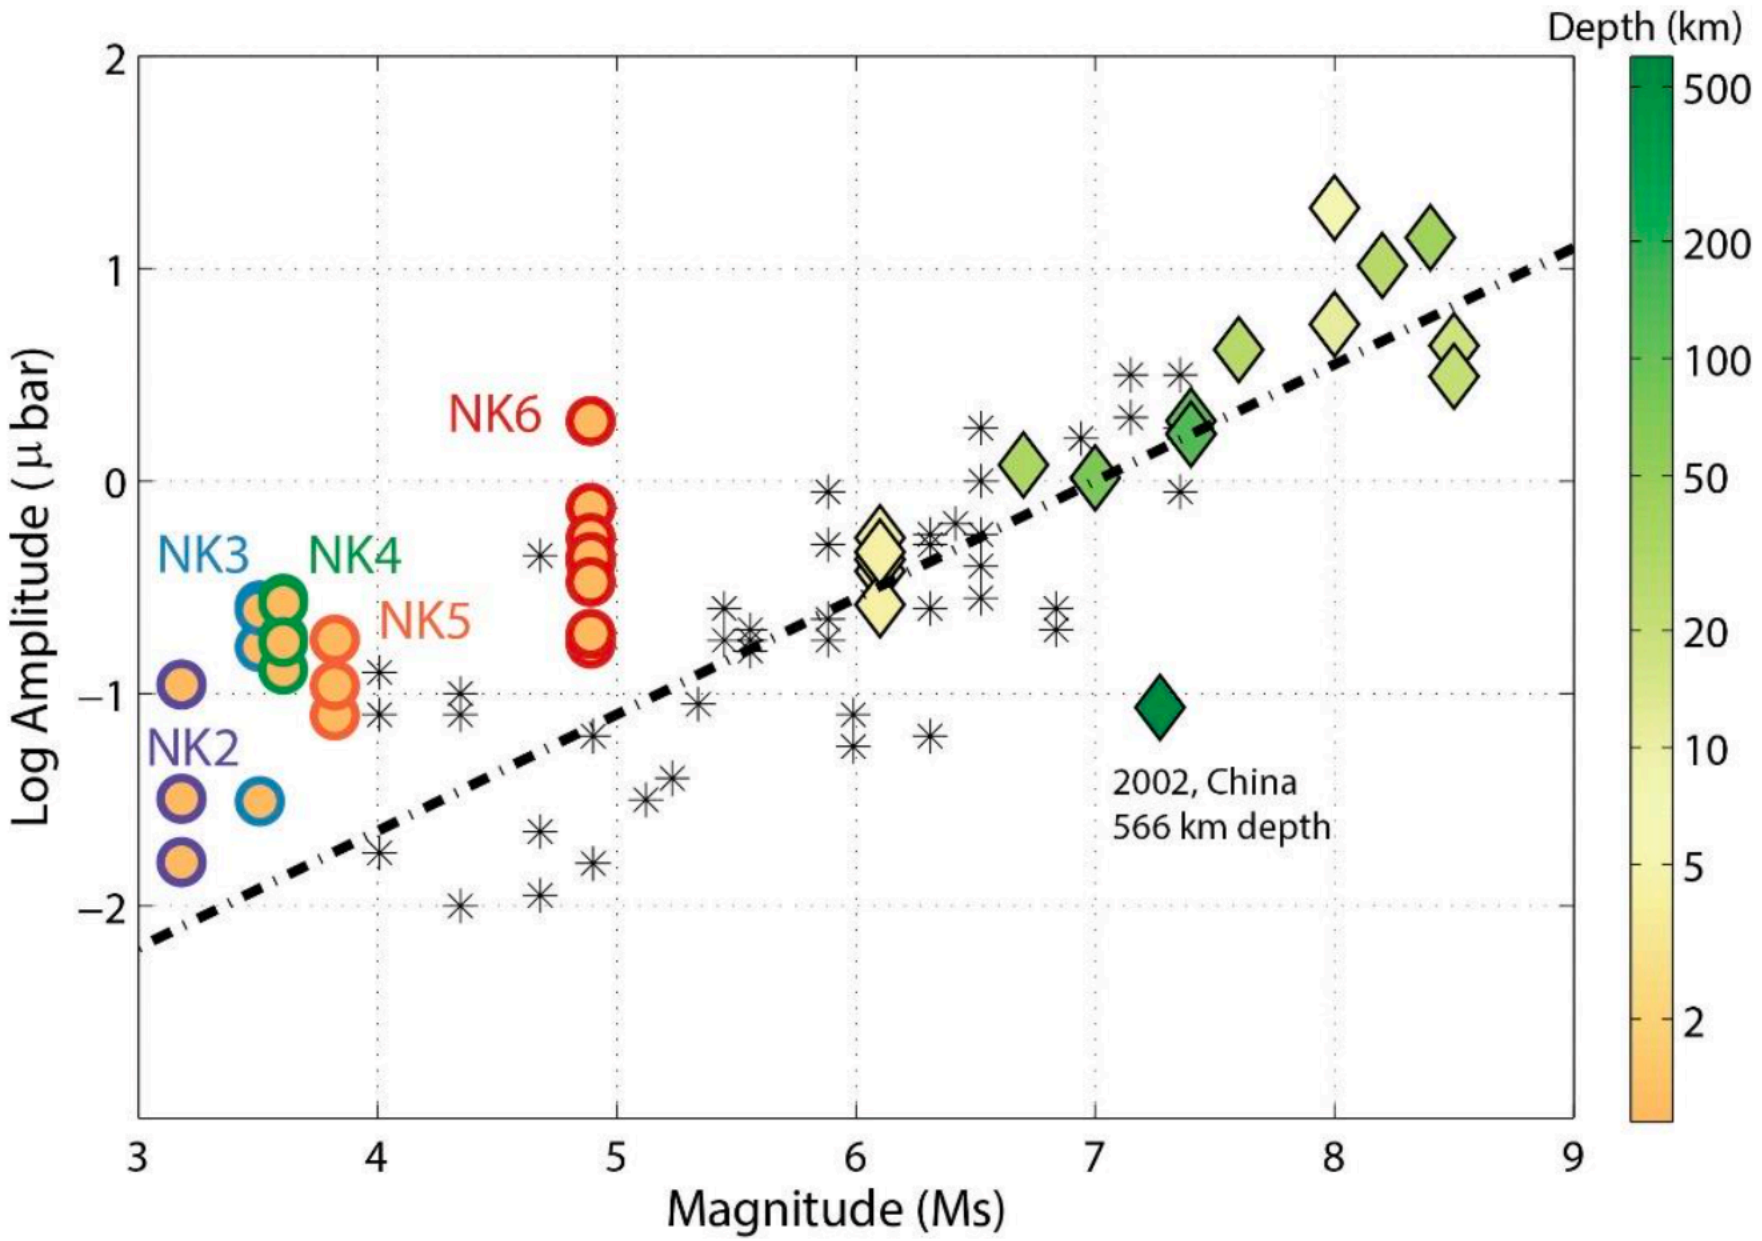

Figure 4. Seismic source type discriminant based on the infrasound amplitude. Comparisons of measured infrasound amplitudes from the North Korean nuclear tests and those of earthquakes that generated infrasound signals. Relationship (dash-dotted line) between earthquake surface wave magnitude (M_S) and the distance- and wind-corrected amplitudes (A_n) of the infrasound signals observed for shallow to deep earthquakes (stars from Mutschlecner & Whitaker (2005); diamonds from Hernandez *et al.* (2018), Le Pichon *et al.* (2006), Che *et al.* (2013)) is shown.
